

Section 11.6

1.) $\sum_{n=1}^{\infty} (-1)^{n+1} \cdot \frac{1}{n^2}$; let $a_n = \frac{1}{n^2}$, then a_n is +, \downarrow , and $\lim_{n \rightarrow \infty} \frac{1}{n^2} = 0$, so

series converges by alternating series test

3.) $\sum_{n=1}^{\infty} (-1)^{n+1} \left(\frac{n}{10}\right)^n$; let $a_n = \left(\frac{n}{10}\right)^n$, then $\lim_{n \rightarrow \infty} \left(\frac{n}{10}\right)^n = \infty$ so $\lim_{n \rightarrow \infty} (-1)^{n+1} \left(\frac{n}{10}\right)^n \neq 0$,

and series diverges by the nth-term test

4.) $\sum_{n=1}^{\infty} (-1)^{n+1} \cdot \frac{10^n}{n^{10}}$; let $a_n = \frac{10^n}{n^{10}}$, then

compare a_n and a_{n+1} :

$$\frac{10^n}{n^{10}} \sim \frac{10^{n+1}}{(n+1)^{10}} \quad \text{iff}$$

$$\frac{10^n}{10^{n+1}} \sim \frac{n^{10}}{(n+1)^{10}} \quad \text{iff} \quad \frac{1}{10} \sim \left(\frac{n}{n+1}\right)^{10}$$

$$\text{iff} \quad \left(\frac{1}{10}\right)^{1/10} \sim \frac{n}{n+1} \quad \text{iff} \quad (\approx 0.79) \sim \frac{n}{n+1};$$

we see that $0.79 < \frac{n}{n+1}$ for $n=4, 5, 6, \dots$;

this means $a_n < a_{n+1}$ for $n=4, 5, 6, \dots$;

since $a_4 > 0$ and the sequence is \uparrow ,

it follows that $\lim_{n \rightarrow \infty} \frac{10^n}{n^{10}} \neq 0$ and

hence $\lim_{n \rightarrow \infty} (-1)^{n+1} \cdot \frac{10^n}{n^{10}} \neq 0$, so series

diverges by n th-term test

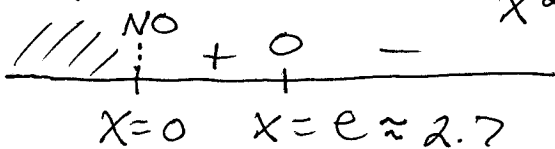

5.) $\sum_{n=2}^{\infty} (-1)^{n+1} \cdot \frac{1}{\ln n}$; Let $a_n = \frac{1}{\ln n}$, then a_n is $+$, \downarrow , and $\lim_{n \rightarrow \infty} \frac{1}{\ln n} = 0$, so series

converges by alternating series test

6.) $\sum_{n=1}^{\infty} (-1)^{n+1} \cdot \frac{\ln n}{n}$; Let $a_n = \frac{\ln n}{n}$, then

a_n is $+$ (for $n \geq 2$) and $\lim_{n \rightarrow \infty} \frac{\ln n}{n} \stackrel{\text{"}\infty/\infty\text{"}}{=} \lim_{n \rightarrow \infty} \frac{1}{1} = 0$;

$f(x) = \frac{\ln x}{x} \xrightarrow{D} f'(x) = \frac{x \cdot \frac{1}{x} - \ln x}{x^2}$

$= \frac{1 - \ln x}{x^2}$  $x=0$ $x=e \approx 2.7$ f'

so a_n is $+$ for $n \geq 3$, \downarrow for $n \geq 3$, and $\lim_{n \rightarrow \infty} a_n = 0$, so $\sum_{n=3}^{\infty} (-1)^{n+1} \frac{\ln n}{n}$

converges by alternating series test,

so $\sum_{n=1}^{\infty} (-1)^{n+1} \cdot \frac{\ln n}{n}$ converges

9.) $\sum_{n=1}^{\infty} (-1)^{n+1} \cdot \frac{\sqrt{n+1}}{n+1}$; Let $a_n = \frac{\sqrt{n+1}}{n+1}$, then

a_n is $+$ and $\lim_{n \rightarrow \infty} \frac{\sqrt{n+1}}{n+1} \stackrel{\text{"}\infty/\infty\text{"}}{=} \lim_{n \rightarrow \infty} \frac{1}{2\sqrt{n}} = 0$;

$f(x) = \frac{\sqrt{x+1}}{x+1} \xrightarrow{D} f'(x) = \frac{(x+1) \cdot \frac{1}{2\sqrt{x}} - (\sqrt{x+1})(1)}{(x+1)^2}$

$$= \frac{\frac{x+1}{2\sqrt{x}} - \frac{2\sqrt{x}(\sqrt{x}+1)}{2\sqrt{x}}}{(x+1)^2} = \frac{(x+1) - (2x+2\sqrt{x})}{2\sqrt{x} \cdot (x+1)^2}$$

$$= \frac{1-x-2\sqrt{x}}{2\sqrt{x}(x+1)^2} \quad \text{---} \quad \text{---} \quad f'$$

$x=1$

so a_n is +, ↓, and $\lim_{n \rightarrow \infty} a_n = 0$ so

series converges by alternating series test

10.) $\sum_{n=1}^{\infty} (-1)^{n+1} \cdot 3 \frac{\sqrt{n+1}}{\sqrt{n+1}}$; Let $a_n = \frac{3\sqrt{n+1}}{\sqrt{n+1}}$,

then $\lim_{n \rightarrow \infty} \frac{3\sqrt{n+1}}{\sqrt{n+1}} \stackrel{\infty}{=} \lim_{n \rightarrow \infty} \frac{3}{\frac{1}{2\sqrt{n}}}$

$$= \lim_{n \rightarrow \infty} 3 \frac{\sqrt{n}}{\sqrt{n+1}} = \lim_{n \rightarrow \infty} 3 \sqrt{\frac{n}{n+1}} = \lim_{n \rightarrow \infty} 3 \sqrt{\frac{1}{1+\frac{1}{n}}}$$

$$= 3 \sqrt{\frac{1}{1+0}} = 3(1) = 3; \text{ thus,}$$

$$\lim_{n \rightarrow \infty} (-1)^{n+1} \cdot \frac{3\sqrt{n+1}}{\sqrt{n+1}} \neq 0 \text{ so series}$$

diverges by n th-term test

12.) $\sum_{n=1}^{\infty} (-1)^{n+1} \cdot \frac{(0.1)^n}{n}$; consider series

$$\sum_{n=1}^{\infty} \frac{(0.1)^n}{n} \text{ then } \lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n} = \lim_{n \rightarrow \infty} \frac{\frac{(0.1)^{n+1}}{n+1}}{\frac{(0.1)^n}{n}}$$

$$= \lim_{n \rightarrow \infty} \frac{(0.1)^{n+1}}{(0.1)^n} \cdot \frac{n}{n+1} = \lim_{n \rightarrow \infty} (0.1) \cdot \frac{1}{1 + \frac{1}{n}}$$

$$= (0.1) \cdot \frac{1}{1+0} = \frac{1}{10} < 1, \text{ so series}$$

$\sum_{n=1}^{\infty} \frac{(0.1)^n}{n}$ converges by ratio test and series

$\sum_{n=1}^{\infty} (-1)^{n+1} \cdot \frac{(0.1)^n}{n}$ converges absolutely

13.) $\sum_{n=1}^{\infty} (-1)^n \cdot \frac{1}{\sqrt{n}}$ converges by the alternating series test since $a_n = \frac{1}{\sqrt{n}}$ is +, \downarrow , and $\lim_{n \rightarrow \infty} a_n = 0$; but

the series $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n}}$ diverges by

p-series test ($p = \frac{1}{2} \leq 1$), so

series $\sum_{n=1}^{\infty} (-1)^n \cdot \frac{1}{\sqrt{n}}$ converges conditionally

15.) $\sum_{n=1}^{\infty} (-1)^{n+1} \cdot \frac{n}{n^3+1}$; consider series

$$\sum_{n=1}^{\infty} \frac{n}{n^3+1}, \text{ then } \lim_{n \rightarrow \infty} \frac{\frac{n}{n^3+1}}{\frac{1}{n^2}} = \lim_{n \rightarrow \infty} \frac{n^3}{n^3+1}$$

$$= \lim_{n \rightarrow \infty} \frac{1}{1 + \frac{1}{n^3}} = \frac{1}{1+0} = 1; \text{ since } \sum_{n=1}^{\infty} \frac{1}{n^2}$$

converges by p-series test ($p=2 > 1$)

then $\sum_{n=1}^{\infty} \frac{n}{n^3+1}$ converges by limit

comparison test; so $\sum_{n=1}^{\infty} (-1)^{n+1} \cdot \frac{n}{n^3+1}$ converges absolutely

16.) $\sum_{n=1}^{\infty} (-1)^{n+1} \cdot \frac{n!}{2^n}$; Let $a_n = \frac{n!}{2^n}$, then

compare a_n and a_{n+1} :

$$\frac{n!}{2^n} \sim \frac{(n+1)!}{2^{n+1}} \text{ iff } \frac{2^{n+1}}{2^n} \sim \frac{(n+1)!}{n!}$$

iff $2 \sim n+1$; but $2 \leq n+1$ for $n=1, 2, 3, \dots$, so $a_n \leq a_{n+1}$; since

$a_1 = \frac{1}{2}$ and $a_n \leq a_{n+1}$, then

$$\lim_{n \rightarrow \infty} a_n \neq 0, \text{ so } \lim_{n \rightarrow \infty} (-1)^{n+1} \cdot \frac{n!}{2^n} \neq 0$$

and series diverges

18.) $\sum_{n=1}^{\infty} (-1)^n \cdot \frac{\sin n}{n^2}$; consider series

$$\sum_{n=1}^{\infty} \frac{|\sin n|}{n^2}; \quad 0 \leq \frac{|\sin n|}{n^2} \leq \frac{1}{n^2}$$

and $\sum_{n=1}^{\infty} \frac{1}{n^2}$ converges by p -series

test ($p=2 > 1$), so $\sum_{n=1}^{\infty} \frac{|\sin n|}{n^2}$

converges by comparison test; thus $\sum_{n=1}^{\infty} (-1)^n \cdot \frac{\sin n}{n^2}$ converges absolutely

21.) $\sum_{n=1}^{\infty} (-1)^{n+1} \cdot \frac{1+n}{n^2}$ converges by the alternating series test since

$$a_n = \frac{1+n}{n^2} = \frac{1}{n^2} + \frac{1}{n} \text{ is } +, \downarrow, \text{ and}$$

$\lim_{n \rightarrow \infty} a_n = 0$; consider series $\sum_{n=1}^{\infty} \frac{1+n}{n^2}$
 $= \sum_{n=1}^{\infty} \frac{1}{n^2} + \sum_{n=1}^{\infty} \frac{1}{n}$ which diverges
 (by subtle facts about series)
 since $\sum_{n=1}^{\infty} \frac{1}{n^2}$ is convergent p -series
 ($p=2 > 1$) and $\sum_{n=1}^{\infty} \frac{1}{n}$ is divergent
 p -series ($p=1 \leq 1$).

23.) $\sum_{n=1}^{\infty} (-1)^n \cdot n^2 \cdot \left(\frac{2}{3}\right)^n$; consider series
 $\sum_{n=1}^{\infty} n^2 \cdot \left(\frac{2}{3}\right)^n$; then $\lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n} = \lim_{n \rightarrow \infty} \frac{(n+1)^2 \cdot \left(\frac{2}{3}\right)^{n+1}}{n^2 \cdot \left(\frac{2}{3}\right)^n}$
 $= \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n}\right)^2 \cdot \left(\frac{2}{3}\right) = (1)^2 \left(\frac{2}{3}\right) = \frac{2}{3} < 1$,
 so $\sum_{n=1}^{\infty} n^2 \cdot \left(\frac{2}{3}\right)^n$ converges by ratio
 test; thus, $\sum_{n=1}^{\infty} (-1)^n \cdot n^2 \cdot \left(\frac{2}{3}\right)^n$ converges
 absolutely

26.) $\sum_{n=2}^{\infty} (-1)^{n+1} \cdot \frac{1}{n \ln n}$ converges by
 alternating series test since
 $a_n = \frac{1}{n \ln n}$ is $+$, \downarrow , and $\lim_{n \rightarrow \infty} a_n = 0$;
 consider series $\sum_{n=2}^{\infty} \frac{1}{n \ln n}$; let
 $f(x) = \frac{1}{x \ln x}$, then f is $+$, \downarrow , and
 continuous for $x \geq 2$; thus,

$$\int_2^{\infty} \frac{1}{x \ln x} dx = \lim_{A \rightarrow \infty} \int_2^A \frac{1}{x \ln x} dx$$

$$= \lim_{A \rightarrow \infty} \ln|\ln x| \Big|_2^A = \lim_{A \rightarrow \infty} (\ln|\ln A| - \ln|\ln 2|)$$

$$= \infty, \text{ so } \sum_{n=2}^{\infty} \frac{1}{n \ln n} \text{ diverges by}$$

integral test, and $\sum_{n=2}^{\infty} (-1)^{n+1} \cdot \frac{1}{n \ln n}$ converges conditionally

$$27.) \sum_{n=1}^{\infty} (-1)^n \cdot \frac{n}{n+1} ; \lim_{n \rightarrow \infty} \frac{n}{n+1} \stackrel{\infty}{=} \lim_{n \rightarrow \infty} \frac{1}{1} = 1$$

so $\lim_{n \rightarrow \infty} (-1)^n \cdot \frac{n}{n+1} \neq 0$ and series diverges by the n th-term test

$$29.) \sum_{n=1}^{\infty} \frac{(-100)^n}{n!} = \sum_{n=1}^{\infty} (-1)^n \cdot \frac{100^n}{n!} ; \text{ consider}$$

$$\text{series } \sum_{n=1}^{\infty} \frac{100^n}{n!} ; \text{ then } \lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n} = \lim_{n \rightarrow \infty} \frac{100^{n+1}}{(n+1)!} \cdot \frac{n!}{100^n}$$

$$= \lim_{n \rightarrow \infty} \frac{100^{n+1}}{100^n} \cdot \frac{n!}{(n+1)!} = \lim_{n \rightarrow \infty} 100 \cdot \frac{1}{n+1} = 0 < 1,$$

so $\sum_{n=1}^{\infty} \frac{100^n}{n!}$ converges by ratio test

and $\sum_{n=1}^{\infty} \frac{(-100)^n}{n!}$ is absolutely convergent

$$34.) \sum_{n=1}^{\infty} \frac{\cos n\pi}{n} = \frac{\cos \pi}{1} + \frac{\cos 2\pi}{2} + \frac{\cos 3\pi}{3} + \dots$$

$$= -\frac{1}{1} + \frac{1}{2} + \frac{-1}{3} + \frac{1}{4} + \dots = \sum_{n=1}^{\infty} (-1)^n \cdot \frac{1}{n} ;$$

Let $a_n = \frac{1}{n}$, then a_n is +, \downarrow , and
 $\lim_{n \rightarrow \infty} a_n = 0$, so $\sum_{n=1}^{\infty} (-1)^n \cdot \frac{1}{n}$ converges
 by alternating series test; but
 series $\sum_{n=1}^{\infty} \frac{1}{n}$ is a divergent p -series
 ($p=1 \leq 1$), so $\sum_{n=1}^{\infty} (-1)^n \cdot \frac{1}{n}$ converges
 conditionally.

38.) $\sum_{n=1}^{\infty} (-1)^n \cdot \frac{(n!)^2 \cdot 3^n}{(2n+1)!}$; consider series
 $\sum_{n=1}^{\infty} \frac{(n!)^2 \cdot 3^n}{(2n+1)!}$, then $\lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n} = \lim_{n \rightarrow \infty} \frac{((n+1)!)^2 \cdot 3^{n+1}}{(2(n+1)+1)!} \cdot \frac{(2n+1)!}{(n!)^2 \cdot 3^n}$
 $= \lim_{n \rightarrow \infty} \frac{(n+1)!(n+1)! \cdot 3^{n+1} \cdot (2n+1)!}{n! \cdot n! \cdot 3^n \cdot (2n+3)!} \cdot \frac{(n!)^2 \cdot 3^n}{(2n+1)!}$
 $= \lim_{n \rightarrow \infty} (n+1)(n+1) \cdot 3 \cdot \frac{1}{(2n+3)(2n+2)}$
 $= \lim_{n \rightarrow \infty} \frac{3n^2 + 6n + 3}{4n^2 + 10n + 6} = \lim_{n \rightarrow \infty} \frac{3 + \frac{6}{n} + \frac{3}{n^2}}{4 + \frac{10}{n} + \frac{6}{n^2}}$
 $= \frac{3+0+0}{4+0+0} = \frac{3}{4} < 1$, so $\sum_{n=1}^{\infty} \frac{(n!)^2 \cdot 3^n}{(2n+1)!}$

converges by ratio test and
 $\sum_{n=1}^{\infty} (-1)^n \cdot \frac{(n!)^2 \cdot 3^n}{(2n+1)!}$ converges
 absolutely

39.) $\sum_{n=1}^{\infty} (-1)^n \cdot (\sqrt{n+1} - \sqrt{n})$
 $= \sum_{n=1}^{\infty} (-1)^n \cdot (\sqrt{n+1} - \sqrt{n}) \cdot \frac{(\sqrt{n+1} + \sqrt{n})}{(\sqrt{n+1} + \sqrt{n})}$

$= \sum_{n=1}^{\infty} (-1)^n \cdot \frac{1}{\sqrt{n+1} + \sqrt{n}}$, which converges by the alternating series test since $a_n = \frac{1}{\sqrt{n+1} + \sqrt{n}}$ is +, ↓,

and $\lim_{n \rightarrow \infty} a_n = 0$; consider series

$$\sum_{n=1}^{\infty} \frac{1}{\sqrt{n+1} + \sqrt{n}}; \text{ then } \lim_{n \rightarrow \infty} \frac{\frac{1}{\sqrt{n+1} + \sqrt{n}}}{\frac{1}{\sqrt{n}}}$$

$$= \lim_{n \rightarrow \infty} \frac{\sqrt{n}}{\sqrt{n+1} + \sqrt{n}} \cdot \frac{\sqrt{n}}{1} = \lim_{n \rightarrow \infty} \frac{1}{\sqrt{1 + \frac{1}{n}} + 1}$$

$$= \frac{1}{1+1} = \frac{1}{2}; \text{ since } \sum_{n=1}^{\infty} \frac{1}{\sqrt{n}} \text{ is a}$$

divergent p -series ($p = \frac{1}{2} \leq 1$),

$\sum_{n=1}^{\infty} \frac{1}{\sqrt{n+1} + \sqrt{n}}$ diverges by limit comparison test, and

$\sum_{n=1}^{\infty} (-1)^n (\sqrt{n+1} - \sqrt{n})$ is conditionally convergent

$$46.) \sum_{n=1}^{\infty} (-1)^{n+1} \cdot \frac{1}{10^n} = \underbrace{\frac{1}{10} + \frac{-1}{10^2} + \frac{1}{10^3} + \frac{-1}{10^4}}_{S_4 = 0.0909} + \frac{1}{10^5} + \frac{-1}{10^6} + \dots$$

↑
error $R_4 < 0.00001$

so $S_4 = 0.0909$ estimates (under-estimate) the exact value of $\sum_{n=1}^{\infty} (-1)^{n+1} \cdot \frac{1}{10^n}$

with error at most $R_4 < 0.00001$

$$50.) \sum_{n=0}^{\infty} (-1)^n \cdot \frac{1}{n!} = \underbrace{1 - \frac{1}{1!} + \frac{2}{2!} - \frac{3}{3!} + \dots + (-1)^n \cdot \frac{1}{n!}}_{S_n} + (-1)^{n+1} \cdot \frac{1}{(n+1)!} + \dots$$

error $R_n < \frac{1}{(n+1)!}$

require that $\frac{1}{(n+1)!} < 5 \times 10^{-6} = 0.000005$;

by calculator: $\frac{1}{8!} \approx 2.5 \times 10^{-5}$,

$$\frac{1}{9!} \approx 2.7 \times 10^{-6} < 5 \times 10^{-6};$$

so choose $n=8$; then

$$\sum_{n=0}^{\infty} (-1)^n \cdot \frac{1}{n!} \approx S_8 = \cancel{1} - \cancel{\frac{1}{1!}} + \frac{2}{2!} - \frac{3}{3!} + \frac{4}{4!} - \frac{5}{5!} + \frac{6}{6!} - \frac{7}{7!} + \frac{8}{8!}$$

$$= 1 - \frac{1}{2!} + \frac{1}{3!} - \frac{1}{4!} + \frac{1}{5!} - \frac{1}{6!} + \frac{1}{7!}$$

$$= 0.632142857143 \quad \text{and absolute error is at most } 0.000005.$$

$$54.) 1 - \frac{1}{2} + \frac{1}{2} - \frac{1}{3} + \frac{1}{3} - \frac{1}{4} + \frac{1}{4} - \frac{1}{5} + \frac{1}{5} - \frac{1}{6} + \dots \quad (\text{I})$$

$$S_1 = 1,$$

$$\rightarrow S_2 = 1 - \frac{1}{2} = \frac{1}{2},$$

$$S_3 = 1 - \cancel{\frac{1}{2}} + \cancel{\frac{1}{2}} = 1,$$

$$\rightarrow S_4 = 1 - \cancel{\frac{1}{2}} + \cancel{\frac{1}{2}} - \frac{1}{3} = \frac{2}{3},$$

$$S_5 = 1 - \cancel{\frac{1}{2}} + \cancel{\frac{1}{2}} - \cancel{\frac{1}{3}} + \cancel{\frac{1}{3}} = 1,$$

$$\rightarrow S_6 = 1 - \cancel{\frac{1}{2}} + \cancel{\frac{1}{2}} - \cancel{\frac{1}{3}} + \cancel{\frac{1}{3}} - \frac{1}{4} = \frac{3}{4}, \dots$$

$$S_{2n} = \frac{n}{n+1} \quad ; \quad S_{2n+1} = 1 \quad ;$$

$$\frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \frac{1}{4 \cdot 5} + \frac{1}{5 \cdot 6} + \dots \quad (\text{II})$$

$$S_1 = \frac{1}{2} \quad ;$$

$$S_2 = \frac{1}{2} + \frac{1}{6} = \frac{2}{3} \quad ;$$

$$S_3 = \frac{1}{2} + \frac{1}{6} + \frac{1}{12} = \frac{3}{4} \quad ,$$

$$S_4 = \frac{1}{2} + \frac{1}{6} + \frac{1}{12} + \frac{1}{20} = \frac{4}{5} \quad , \dots$$

$$S_n = \frac{n}{n+1} \quad ;$$

for series (I), since $\lim_{n \rightarrow \infty} S_{2n} = \lim_{n \rightarrow \infty} \frac{n}{n+1} = 1$

and $\lim_{n \rightarrow \infty} S_{2n+1} = \lim_{n \rightarrow \infty} 1 = 1$, so sequence

of partial sums converges to 1, so the series (I) has sum 1;

for series (II), the sequence of partial sums, S_n satisfies

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \frac{n}{n+1} = 1, \text{ so series (II)}$$

has sum 1.

$$58.) \text{ Both } \sum_{n=1}^{\infty} (-1)^{n+1} \cdot \frac{1}{\sqrt{n}} = 1 - \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{3}} - \frac{1}{\sqrt{4}} + \dots$$

$$\text{and } \sum_{n=1}^{\infty} (-1)^n \cdot \frac{1}{\sqrt{n}} = -1 + \frac{1}{\sqrt{2}} - \frac{1}{\sqrt{3}} + \frac{1}{\sqrt{4}} - \dots$$

converge by the alternating series test, but

$$\sum_{n=1}^{\infty} (-1)^{n+1} \cdot \frac{1}{\sqrt{n}} \cdot (-1)^n \cdot \frac{1}{\sqrt{n}} = \sum_{n=1}^{\infty} (-1) \cdot \frac{1}{n} = -(1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \dots)$$

diverges by the p -series test.
