

# Lecture 9: From the Sturm-Liouville Theory to Discrete Cosine/Sine Transforms

Note Title

## ★ Fourier Series, Boundary Value Problems, and the Sturm-Liouville Theory

It is important to note that the Fourier basis fns  $\left\{ \frac{1}{\sqrt{A}} e^{2\pi i k x / A} \right\}_{k \in \mathbb{Z}}$  are **eigenfunctions** of the following BVP of the 2nd order ODE:

1D Laplacian eigenval. Problem!

$$\begin{cases} -u''(x) = \lambda u(x) & x \in [-\frac{A}{2}, \frac{A}{2}] \\ u(-A/2) = u(A/2) \\ u'(-A/2) = u'(A/2) \end{cases} \text{ periodic bdry. cond.!$$

This is one example of the so-called **regular Sturm-Liouville Problem**.

$\lambda$  is the eigenvalue, in fact  $\lambda = \lambda_k = (2\pi k / A)^2$ , and the corresponding eigenfn is  $\varphi_k(x) = \frac{1}{\sqrt{A}} e^{2\pi i k x / A}$ .

Def. A **regular Sturm-Liouville problem** on the interval  $I = [a, b]$  is specified by the following data:

(i) A **formally self-adjoint** differential operator  $\mathcal{L}$  defined as

$$\mathcal{L} u(x) := \frac{1}{w(x)} \left\{ - (p(x) u'(x))' + q(x) u(x) \right\}, \quad \forall x \in I.$$

where  $p \in C^1(I)$ ,  $q, w \in C(I)$ ,  $p > 0$ ,  $w > 0$ ,  $q \in \mathbb{R}$ ,  $\forall x \in I$ .

(ii) A set of **self-adjoint bdry. cond.'s**  
 $B_1(u) = 0$  &  $B_2(u) = 0$  for  $\mathcal{L}$ .

The objective of a regular SL problem is to find all solutions of the following BVP:

$$\begin{cases} \mathcal{L}u = \lambda u \\ B_1(u) = B_2(u) = 0 \end{cases}$$

$\Rightarrow$  Solutions exist for specific  $\lambda$ , i.e., eigenvalues of such rSLP.

Define  $L_w^2[a, b] := \{f \mid \|f\|_{2,w} < \infty\}$   
 where  $\|f\|_{2,w}^2 = \|f\|_w^2 := \int_a^b |f(x)|^2 w(x) dx$

Define the **weighted inner product**:

$$\langle f, g \rangle_w := \int_a^b f(x) \overline{g(x)} w(x) dx.$$

Going back to the operator  $\mathcal{L}$ ,

$\forall f, g \in L_w^2[a, b]$ ,

$$\langle \mathcal{L}f, g \rangle_w = \langle f, \mathcal{L}^*g \rangle_w$$

$$\stackrel{\text{Int. by parts}}{\Downarrow} \langle f, \mathcal{L}g \rangle_w + \left[ -p(f' \bar{g} - f \bar{g}') \right]_a^b$$

if  $\mathcal{L}$  is **formally self-adjoint**.

If  $B_j(f) = B_j(g) = 0$ ,  $j=1,2$ ,  $f, g \in L^2_w[a,b]$ ,  
lead to  $[-p(f' \bar{g} - f \bar{g}')]_a^b = 0$ , then

these bdy. cond.'s are said to be **self-adjoint**, and together with the formally self-adjoint operator  $L$ , we have:

$$\langle Lf, g \rangle_w = \langle f, Lg \rangle_w$$

In this case, the problem is called **self-adjoint**.

The most important thm's here are:

Thm For every r SLP, the following holds:

- (a) All eigenvalues are **real**;
- (b) Eigenfunctions corresponding to distinct eigenvalues are **orthogonal** w.r.t.  $\langle \cdot, \cdot \rangle_w$ ;
- (c) The eigenspace (i.e., the subspace spanned by those eigenfcn's belonging to an eigenval.) for any eigenvalue  $\lambda$  is at most 2 dim.

If the bdy. cond. is separated, it is always 1 dim.

Thm For every r SLP,  $\exists$  an **ONB**  $\{\varphi_n\}_{n \in \mathbb{N}}$  of  $L^2_w[a,b]$  s.t.  $\{\varphi_n\}$  are **eigenfcn's**.

If  $\lambda_n$ : the corresp. eigenval. to  $\varphi_n$ , then  $\lambda_n \rightarrow \infty$  as  $n \rightarrow \infty$ . Moreover if

$f \in C^2[a,b]$ ,  $B_1(f) = B_2(f) = 0$ , then

$$\sum_{n=1}^N \langle f, \varphi_n \rangle_w \varphi_n \rightarrow f \text{ **uniformly** as } N \rightarrow \infty.$$

So,  $\left\{ \begin{array}{l} -u'' = \lambda u, \\ u(-A/2) = u(A/2) \\ u'(-A/2) = u'(A/2) \end{array} \right\}$  is one of the simplest rSLPs!

Remark: A **singular** SLP is an SLP with  
 (i)  $p(a) = 0$  or  $p(b) = 0$ .  
 in addition  $w(a) = 0$  or  $+\infty$  or  $w(b) = 0$  or  $+\infty$ ;  
 or (ii)  $a = -\infty$  or  $b = +\infty$ .

Almost all of classical orthogonal polynomials are generated by sSLP's with specific B.C. & weight fcn's.

	$p$	$q$	$w$	$\lambda_n$	$[a, b]$
Legendre poly.	$1-x^2$	0	1	$n(n+1)$	$[-1, 1]$
Chebyshev poly.	$\sqrt{1-x^2}$	0	$1/\sqrt{1-x^2}$	$n^2$	$[-1, 1]$
Hermite poly.	$e^{-x^2}$	0	$e^{-x^2}$	$2n$	$(-\infty, \infty)$
$\alpha > -1$ Laguerre poly.	$x^{\alpha+1} e^{-x}$	0	$x^\alpha e^{-x}$	$n$	$[0, \infty)$
Prolate Spheroidal wave fcn's	$1-x^2$	$c^2 x^2$	1	$\lambda$	$[-1, 1]$
$\vdots$	$\vdots$	$\vdots$	$\vdots$	$(0 < \lambda < 1)$	$\vdots$

In 2D and higher, the problem becomes more intricate, of course.

The simplest version is that of **Laplacian eigenvalue problem**:

$$-\Delta u = \lambda u \quad \text{in } \Omega = \text{a domain in } \mathbb{R}^d$$

$$\left. \begin{array}{l} \text{Dirichlet} \\ \text{Neumann} \end{array} \right\} \text{ or } \begin{cases} u = 0 \\ \partial_\nu u = 0 \end{cases} \quad \text{on } \partial\Omega \text{ (a bdy of } \Omega).$$

## ★ Fourier Sine & Cosine Series

... come out naturally as eigenfcn's on the simple r SLP with the following B.C.'s:

$$-u'' = \lambda u, \quad x \in \left[-\frac{A}{2}, \frac{A}{2}\right].$$

$$\text{i.e., } p(x) \equiv 1, \quad q(x) \equiv 0, \quad w(x) \equiv 1.$$

$$\text{Dirichlet B.C.: } u\left(-\frac{A}{2}\right) = u\left(\frac{A}{2}\right) = 0 \Rightarrow \left\{ \sqrt{\frac{2}{A}} \sin \frac{2\pi k}{A} x \right\}_{k=1}^{\infty}$$

$$\text{Neumann B.C.: } u'\left(-\frac{A}{2}\right) = u'\left(\frac{A}{2}\right) = 0 \Rightarrow \left\{ \frac{1}{\sqrt{A}} \right\} \cup \left\{ \sqrt{\frac{2}{A}} \cos \frac{2\pi k}{A} x \right\}_{k=1}^{\infty}$$

But clearly  $\exists$  other possibilities, e.g.,

$$u\left(-\frac{A}{2}\right) = u'\left(\frac{A}{2}\right) = 0 \Rightarrow \left\{ \sqrt{\frac{2}{A}} \sin \frac{2\pi(k+\frac{1}{2})}{A} x \right\}_{k=0}^{\infty}$$

$$u'\left(-\frac{A}{2}\right) = u\left(\frac{A}{2}\right) = 0 \Rightarrow \left\{ \sqrt{\frac{2}{A}} \cos \frac{2\pi(k+\frac{1}{2})}{A} x \right\}_{k=0}^{\infty}$$

Discretization gives us further intricacies!

## ★ Discrete Sine & Cosine Transforms

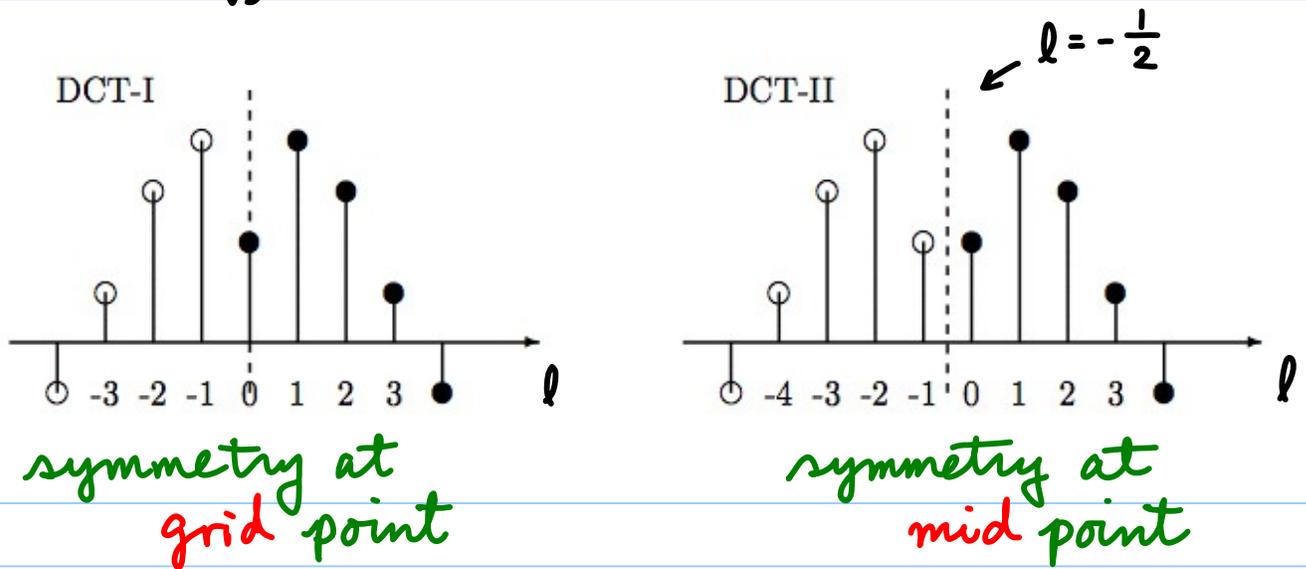

Define

$$\begin{cases} F_s^I[k] := \sum_{l=1}^{N-1} f[l] \sin \left( \frac{\pi k l}{N} \right) & : \text{DST-I} \\ F_c^I[k] := \sum_{l=0}^{N-1} f[l] \cos \left( \frac{\pi k l}{N} \right) & : \text{DCT-I} \end{cases}$$

not  $\frac{2\pi k l}{N}$  Type

These can be computed via normal FFT (of length  $2N$ ) by appropriately extending the original sequence.

≡ 4 different types of DSTs & DCTs with different B.C.'s.

For convenience, let's define the following weight vector for orthogonality:

$$b[l] := \begin{cases} 0 & \text{if } l < 0 \text{ or } l > N; \\ 1/\sqrt{2} & \text{if } l = 0 \text{ or } l = N; \\ 1 & \text{if } 1 \leq l \leq N-1. \end{cases}$$

Now we can define the following transf. matrices:

$$\left\{ \begin{array}{l} \text{DCT-I: } C_{N+1}^{\text{I}} \in \mathbb{R}^{(N+1) \times (N+1)}, \quad C_{N+1}^{\text{I}}[k, l] = b[k] b[l] \sqrt{\frac{2}{N}} \cos \frac{\pi k l}{N} \\ \text{DCT-II: } C_N^{\text{II}} \in \mathbb{R}^{N \times N}, \quad C_N^{\text{II}}[k, l] = b[k] \sqrt{\frac{2}{N}} \cos \frac{\pi k (l + \frac{1}{2})}{N} \\ \text{DCT-III: } C_N^{\text{III}} \in \mathbb{R}^{N \times N}, \quad C_N^{\text{III}}[k, l] = b[l] \sqrt{\frac{2}{N}} \cos \frac{\pi (k + \frac{1}{2}) l}{N} \\ \text{DCT-IV: } C_N^{\text{IV}} \in \mathbb{R}^{N \times N}, \quad C_N^{\text{IV}}[k, l] = \sqrt{\frac{2}{N}} \cos \frac{\pi (k + \frac{1}{2}) (l + \frac{1}{2})}{N} \end{array} \right.$$

For DCT-I,

$k, l = 0, 1, \dots, N$

For others,  $k, l = 0, 1, \dots, N-1$ .

$k$ : frequency index

$l$ : space (or time) index.

$$\left\{ \begin{array}{l} \text{DST-I: } S_{N-1}^{\text{I}} \in \mathbb{R}^{(N-1) \times (N-1)}, S_{N-1}^{\text{I}}[k, l] = \sqrt{\frac{2}{N}} \sin \frac{\pi k l}{N} \\ \text{DST-II: } S_N^{\text{II}} \in \mathbb{R}^{N \times N}, S_N^{\text{II}}[k, l] = b[k+1] \sqrt{\frac{2}{N}} \sin \frac{\pi (k+1)(l+\frac{1}{2})}{N} \\ \text{DST-III: } S_N^{\text{III}} \in \mathbb{R}^{N \times N}, S_N^{\text{III}}[k, l] = b[l+1] \sqrt{\frac{2}{N}} \sin \frac{\pi (k+\frac{1}{2})(l+1)}{N} \\ \text{DST-IV: } S_N^{\text{IV}} \in \mathbb{R}^{N \times N}, S_N^{\text{IV}}[k, l] = \sqrt{\frac{2}{N}} \sin \frac{\pi (k+\frac{1}{2})(l+\frac{1}{2})}{N} \end{array} \right.$$

For DST-I,  $k, l = 1, \dots, N-1$

For others,  $k, l = 0, 1, \dots, N-1$ .

### Remarks:

(1) In the **JPEG** image compression standard, the 2D version of **DCT-II** is used on patches of size  $8 \times 8$  pixels via the tensor product of 1D **DCT-II**.

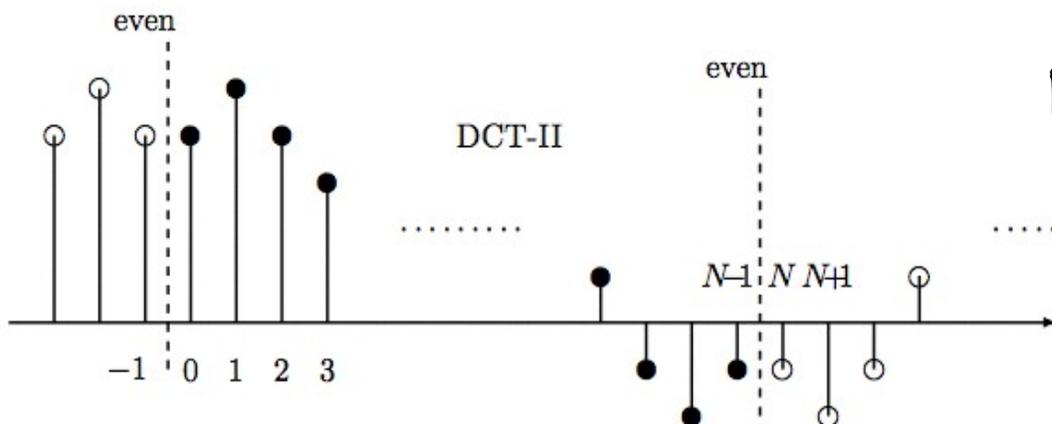

(2) The MATLAB function "**dct**" is the **DCT-II**, and is included in the Signal Processing Toolbox.

(3) The MATLAB function "**dst**" is the **DST-I** (unnormalized version), and is included in the PDE Toolbox.

# ★ Comments on the B.C.'s

	<u>left endpt.</u>		<u>right endpt</u>
DCT-I	grid pt, Neumann		grid pt, Neumann
II	mid pt, Neumann		mid pt, Neumann
III	grid pt, Neumann		grid pt, Dirichlet
IV	mid pt, Neumann		mid pt, Dirichlet
DST-I	grid pt, Dirichlet		grid pt, Dirichlet
II	mid pt, Dirichlet		mid pt, Dirichlet
III	grid pt, Dirichlet		grid pt, Neumann
IV	mid pt, Dirichlet		mid pt, Neumann

# ★ DCT-II

Then  
periodized  
with period  
**2N**

Define

$$\tilde{f}[l] := \begin{cases} f[l] & \text{if } l = 0, 1, \dots, N-1. \\ f[2N-l-1] & \text{if } l = N, \dots, 2N-1. \end{cases}$$

Then consider

$$\begin{aligned} D_{2N}\{\tilde{f}\}[k] &= \sum_{l=0}^{2N-1} \tilde{f}[l] \omega_{2N}^{-kl} \\ &= \sum_{l=0}^{N-1} f[l] \omega_{2N}^{-kl} + \sum_{l=N}^{2N-1} f[2N-l-1] \omega_{2N}^{-kl} \\ &= \sum_{l=0}^{N-1} f[l] \omega_{2N}^{-kl} + \sum_{m=N-1}^0 f[m] \omega_{2N}^{-k(2N-1-m)} \quad \leftarrow 2N-l-1=m \\ &= \sum_{l=0}^{N-1} f[l] \omega_{2N}^{-kl} + \sum_{m=0}^{N-1} f[m] \omega_{2N}^{km} \cdot \omega_{2N}^k \quad \leftarrow \omega_{2N}^{-k \cdot 2N} = 1 \\ &= \sum_{l=0}^{N-1} f[l] \left( \omega_{2N}^{-kl} + \omega_{2N}^{\left(\frac{k}{2} + \frac{k}{2}\right)kl} \cdot \omega_{2N}^{kl} \right) \\ &= \omega_{2N}^{k/2} \sum_{l=0}^{N-1} f[l] \left( \omega_{2N}^{-k(l+\frac{1}{2})} + \omega_{2N}^{k(l+\frac{1}{2})} \right) \\ &= 2 e^{\frac{\pi i k}{N}} \sum_{l=0}^{N-1} f[l] \cos \frac{\pi k(l+\frac{1}{2})}{N} \end{aligned}$$

$$\Rightarrow \frac{1}{\sqrt{2N}} D_{2N}\{\tilde{f}\}[k] = \sqrt{\frac{2}{N}} e^{\frac{\pi i k}{N}} \sum_{l=0}^{N-1} f[l] \cos \frac{\pi k(l+\frac{1}{2})}{N}$$

Viewing samples at half integers on the x-axis in the DFT set up eliminates this phase factor.

- The inverse transform to DCT-II is DCT-III!
