HOW DO WE ESTIMATE THE VALUE OF  $\pi$  ? (An Application of Taylor Series)

A calculator will show that

$$\pi = 3.141592654$$
.

From where does this decimal number come? The following list of Taylor series tells the story.

First, 
$$\frac{1}{1-x} = 1 + x + x^2 + x^3 + x^4 + x^5 + x^6 + \cdots$$

then 
$$\frac{1}{1+x} = \frac{1}{1-(-x)} = 1-x+x^2-x^3+x^4-x^5+\cdots$$

$$\frac{1}{1+x^2} = 1 - x^2 + x^4 - x^6 + x^8 - x^{10} + \cdots$$
1 + x<sup>2</sup>, and

$$\arctan x = x - x^{3}/3 + x^{5}/5 - x^{7}/7 + x^{9}/9 - x^{11}/11 + \cdots$$

Letting x = 1, we get

$$\pi/4$$
 = arctan 1 = 1 - 1/3 + 1/5 - 1/7 + 1/9 - 1/11 + · · ·

and

$$\pi = 4 - 4/3 + 4/5 - 4/7 + 4/9 - 4/11 + 4/13 - 4/15 + \cdots$$

The more terms that are added, the more accurate the estimate for  $\pi$ . For example, the sum of the first 200,001 terms will guarantee accuracy of  $\pi$  to four decimal places.
