Taylor Series and Taylor Polynomials

QUESTION: What connection do ordinary functions, y = f(x), have to power series centered at x = a of the form  $\sum_{n=0}^{\infty} a_n (x-a)^n$ ?

ANSWER: Assume that y = f(x) is a given function and constant "a" is known. Determine a sequence of real numbers  $\{a_n\}$  so that

(T) 
$$f(x) = \sum_{n=0}^{\infty} a_n (x-a)^n = a_0 + a_1 (x-a) + a_2 (x-a)^2 + a_3 (x-a)^3 + \cdots$$

If we substitute x = a in equation (T), we get

$$f(a) = a_0 + a_1(0) + a_2(0)^2 + a_3(0)^3 + \dots = a_0$$

i.e.,

$$a_0=f(a).$$

Now differentiate equation (T) term by term getting

$$f'(x) = a_1 + 2a_2(x-a) + 3a_3(x-a)^2 + 4a_4(x-a)^3 + \cdots$$

If we substitute x = a in this equation, we get

$$f'(a) = a_1 + 2a_2(0) + 3a_3(0)^2 + 4a_4(0)^3 + \cdots = a_1$$
,

i.e.,

$$a_1=f'(a)$$
.

Now differentiate again term by term getting

$$f''(x) = 2a_2 + 3 \cdot 2a_3(x-a) + 4 \cdot 3a_4(x-a)^2 + 5 \cdot 4a_5(x-a)^3 + \cdots$$

If we substitute x = a in this equation, we get

$$f''(a) = 2a_2 + 3 \cdot 2a_3(0) + 4 \cdot 3a_4(0)^2 + 5 \cdot 4a_4(0)^3 + \dots = 2a_2$$

i.e.,

$$a_2=\frac{f''(a)}{2!}.$$

Now differentiate again term by term getting

$$f'''(x) = 3 \cdot 2a_3 + 4 \cdot 3 \cdot 2a_4(x-a) + 5 \cdot 4 \cdot 3a_5(x-a)^2 + 6 \cdot 5 \cdot 4a_6(x-a)^3 + \cdots$$

If we substitute x = a in this equation, we get

$$f'''(a) = 3 \cdot 2a_3 + 4 \cdot 3 \cdot 2a_4(0) + 5 \cdot 4 \cdot 3a_5(0)^2 + 6 \cdot 5 \cdot 4a_6(0)^3 + \dots = 3 \cdot 2a_3,$$

i.e.,  $a_3 = \frac{f'''(a)}{3!}$ .

Continuing this term by term differentiation and substitution process results in the fact that

(S) 
$$a_n = \frac{f^{(n)}(a)}{n!}$$
 for  $n = 0, 1, 2, 3, 4, \cdots$ 

<u>DEFINITION</u>: Equations (T) and (S) together are called the *Taylor Series* for function y = f(x) centered at x = a. For the special case of a = 0, we call the series a *Maclaurin Series*.

<u>DEFINITION</u>: The Taylor Polynomial of degree n centered at x = a for function y = f(x) is given by

(P) 
$$P_n(x;a) = \sum_{k=0}^n a_k (x-a)^k = a_0 + a_1 (x-a) + a_2 (x-a)^2 + a_3 (x-a)^3 + \dots + a_n (x-a)^n$$

and

(S) 
$$a_k = \frac{f^{(k)}(a)}{k!}$$
 for  $k = 0, 1, 2, 3, \dots, n$ .

REMARK: The Taylor Polynomial of degree n centered at x = a for function y = f(x) is the Taylor Series centered at x = a terminated at the nth power of (x - a). It is NOT defined to be the first n or n + 1 terms of the Taylor Series.

QUESTION: For what x-values is an ordinary function y = f(x) equal to its Taylor series centered at x = a, i.e, for what x-values is y = f(x) equal to

$$f(a) + f'(a)(x-a) + \frac{f''(a)}{2!}(x-a)^2 + \frac{f'''(a)}{3!}(x-a)^3 + \frac{f^{(4)}(a)}{4!}(x-a)^4 + \cdots$$
?

ANSWER: Let  $P_n(x;a) = f(a) + f'(a)(x-a) + \frac{f''(a)}{2!}(x-a)^2 + \dots + \frac{f^{(n)}(a)}{n!}(x-a)^n$  be the Taylor Polynomial of degree n centered at x = a and let

 $R_n(x;a) = \frac{f^{(n+1)}(a)}{(n+1)!}(x-a)^{n+1} + \frac{f^{(n+2)}(a)}{(n+2)!}(x-a)^{n+2} + \cdots$ , which is simply the remaining infinite tail of the Taylor Series centered at x=a. It can be shown that

$$R_n(x;a) = \frac{f^{(n+1)}(c_n)}{(n+1)!}(x-a)^{(n+1)},$$

where  $c_n$  is between numbers a and x. This is called the Lagrange form of the Taylor remainder. Those x-values for which y = f(x) is equal to its Taylor series are precisely those x-values for which

$$\lim_{n\to\infty} R_n(x;a) = 0.$$
