

Math Presentation Reflection

What is the main idea you are trying to explain in your talk/poster?

Did you include examples, pictures, or other ways for the audience to gain intuition for the ideas you are communicating?

Is there anything included in your talk/poster that is unnecessary for understanding the main point? Would the presentation be clearer if you remove it? Do you have enough time to include it?

What percentage of your talk/poster is devoted to:

(1) motivation (2) background (3) main idea (4) examples (5) further directions (6) other?

Are there any adjustments you should make to this distribution?

What part of your presentation do you think your audience will most enjoy? Are there parts which you think your audience will not understand or will be confused by?

Is your presentation too long, or are your slides/poster overcrowded? How can you shorten and simplify?
