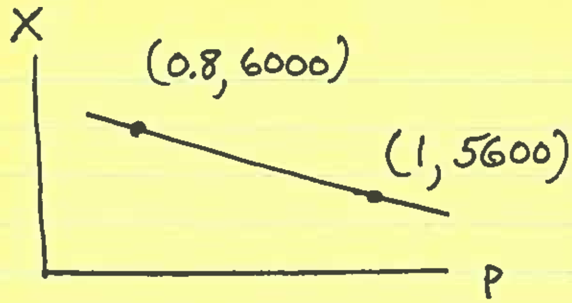
if $x = 6000$, $p = \$.80$ and $x = 5600$, $p = \$1.00$
are points on a linear graph, then :



slope is

$$m = \frac{6000-5600}{0.8-1} = \frac{400}{-0.2} = {}^{-}2000$$

so demand function (line) is

cost $C = 5000 + 0.4X$ and revenue

$$R = pX = \frac{19}{5}X - \frac{X^2}{2000}$$ so that profit

$$P = R - C = \frac{19}{5}X - \frac{X^2}{2000} - \left(5000 + \frac{2}{5}X\right)$$

or $\boxed{P = \dfrac{-X^2}{2000} + \dfrac{17}{5}X - 5000}$; determine

maximum profit $\longrightarrow$

$$P' = \frac{-X}{1000} + \frac{17}{5} = 0 \rightarrow X = 3400$$

so maximum profit occurs when
