### Definition of Relative Extrema
Let \( f \) be a function defined on an interval \( I \) containing \( c \) such that

1. \( f(c) \) is a relative maximum containing \( c \) such that
2. \( f(c) \) is a relative minimum containing \( c \) such that

If \( f(c) \) is a relative extremum, then \( f'(c) = 0 \) or \( f'(c) \) is undefined.

For a continuous function \( f \) on the interval \( I \), the function may have critical numbers at:

* Where \( f'(x) = 0 \) or \( f'(x) \) is undefined.

**Relative Extrema** are points at which the function changes from increasing to decreasing or from decreasing to increasing.

**Definition of Relative Extrema**

If \( f(\xi) \) is a relative extremum of a function, the function is increasing to the left of \( \xi \) and decreasing to the right of \( \xi \) or vice versa.

### Occurrence of Relative Extrema
If \( f \) has a relative maximum or minimum at \( \xi \), then \( f'(\xi) = 0 \) or \( f'(\xi) \) is undefined.

If \( f \) is increasing to the left of \( \xi \) and decreasing to the right of \( \xi \), then \( f(\xi) \) is a relative maximum.

If \( f \) is decreasing to the left of \( \xi \) and increasing to the right of \( \xi \), then \( f(\xi) \) is a relative minimum.

**Relative Maximum:** When the function changes from increasing to decreasing.

**Relative Minimum:** When the function changes from decreasing to increasing.

Concavity

You already know that locating concavity is helpful in determining the intervals on which the graph of a function is curving up or down. A function is concave upward on an interval if its derivative is increasing and concave downward if its derivative is decreasing.

Definition of Concavity

Let $f$ be a differentiable function.

1. A curve that is concave upward on an interval $I$ is said to be concave upward on $I$.
2. A curve that is concave downward on an interval $I$ is said to be concave downward on $I$.

From Figure 3.20, you can determine concavity.

Test for Concavity

Let $f$ be a function whose graph has a derivative.

1. If $f''(x) > 0$ for all $x$, then the graph of $f$ is concave upward on the interval where the derivative is increasing.
2. If $f''(x) < 0$ for all $x$, then the graph of $f$ is concave downward on the interval where the derivative is decreasing.

Exercises 46–47, find the absolute extrema of the function on the interval $[0, \infty)$.

46. Medical Science Coughing forces the trachea (windpipe) to contract, which in turn affects the velocity of the air through the trachea. The velocity of the air during coughing can be modeled by

\[ v = k(R - r)r^2, \quad 0 \leq r < R \]

where $k$ is a constant, $R$ is the normal radius of the trachea, and $r$ is the radius during coughing. What radius $r$ will produce the maximum air velocity?

47. Population The resident population $P$ (in millions) of the United States from 1790 to 2000 can be modeled by

\[ P = 0.00000583t^3 + 0.005003t^2 + 0.13775t + 4.658, \quad -10 \leq t \leq 200 \]

where $t = 0$ corresponds to 1800. (Source: U.S. Census Bureau)

(a) Make a conjecture about the maximum and minimum populations in the U.S. from 1790 to 2000.

(b) Analytically find the maximum and minimum populations over the interval.

(c) Write a brief paragraph comparing your conjecture with your results in part (b).

48. Biology: Fertility Rates The graph of the United States fertility rate shows the number of births per 1000 women in their lifetime according to the birth rate in the particular year. (Source: U.S. National Center for Health Statistics)

(a) Around what year was the fertility rate the highest, and to how many births per 1000 women did this rate correspond?

(b) During which time periods was the fertility rate increasing most rapidly? Most slowly?

(c) During which time periods was the fertility rate decreasing most rapidly? Most slowly?

(d) Give some possible real-life reasons for fluctuations in the fertility rate.

65. Biology Plants do not grow at constant rates during the normal 24-hour period because their growth is affected by sunlight. Suppose that the growth of a certain plant species in a controlled environment is given by the model

\[ h = 0.2t + 0.03 \sin 2\pi t \]

where \( h \) is the height of the plant in inches and \( t \) is the number of days, with \( t = 0 \) corresponding to midnight of day 1 (see figure). During what time of day is the rate of growth of this plant

(a) a maximum?  (b) a minimum?

66. Meteorology The normal average daily temperature in degrees Fahrenheit for a city is given by

\[ T = 55 - 21 \cos \frac{2\pi(t - 32)}{365} \]

where \( t \) is the time in days, with \( t = 1 \) corresponding to January 1. Find the expected date of

(a) the warmest day.  (b) the coldest day.

67. Physics An amusement park ride is constructed such that its height \( h \) in feet above ground in terms of the horizontal distance \( x \) in feet from the starting point can be modeled by

\[ h = 50 + 45 \sin \frac{\pi x}{150}, \quad 0 \leq x \leq 300 \]

(a) Use a graphing utility to graph the model. Be sure to choose an appropriate viewing window.

(b) Determine \( dh/dx \) and evaluate for \( x = 50, 150, 200 \), and 250. Interpret these values of \( dh/dx \).

(c) Find the maximum height and the minimum height of the ride.

(d) Find the distance from the starting point at which the ride’s rate of change is the greatest.

\[ D = 12.2 - 1.9 \cos t \]

where \( t \) represents the time in days (January 1 corresponds to \( t = 0 \)). Find the month number of daylight hours.

\[ D = 12.2 - 1.9 \cos t \]

\[ \theta = 0.2 \cos 8t \]

where \( \theta \) is the angular speed and \( t \) is the time in days. Find the expected date of

(a) the warmest day.  (b) the coldest day.

12. Tides Throughout the year, the height of the water at the end of a dock varies. A particular day can be modeled by

\[ D = 3.5 + 1.5 \cos t \]

where \( t \) = 0 represents January 1. Find the month number of daylight hours.

(a) Derive \( D/dt \) and evaluate the day for \( x = 50, 150, 200 \). Interpret these values of \( D/dt \).

(b) Find the time(s) and the time(s) when the water output is lowest.

(c) Use a graphing utility to confirm your result.
### Meteorology

The number of hours of daylight \(D\) in New Orleans can be modeled by

\[
D = 12.2 - 1.9 \cos \left( \frac{\pi (t + 0.2)}{6} \right), \quad 0 \leq t \leq 12
\]

where \(t\) represents the month, with \(t = 0\) corresponding to January. Find the month \(t\) when New Orleans has the maximum number of daylight hours. What is this maximum number of daylight hours?

In Exercises 73–78, use a graphing utility (a) to graph \(f\) and \(f'\) on the same coordinate axes over the specified interval, (b) to find the critical numbers of \(f\), and (c) to find the interval(s) on which \(f'\) is positive and the interval(s) on which it is negative. Note the behavior of \(f\) in relation to the sign of \(f'\).

#### Exercise

- **Function**: 
  - **Interval**: 
    - 73. \(f(t) = t^2 \sin t\) (0, 2\(\pi\))
    - 74. \(f(x) = \frac{x}{2} + \cos \frac{x}{2}\) (0, 4\(\pi\))
    - 75. \(f(x) = \sin x - \frac{1}{3} \sin 3x + \frac{1}{5} \sin 5x\) (0, \(\pi\))
    - 76. \(f(x) = x \sin x\) (0, \(\pi\))
    - 77. \(f(x) = \sqrt{2x} \sin x\) (0, 2\(\pi\))
    - 78. \(f(x) = 4e^{-0.5x} \sin \pi x\) (0, 4)

#### Tides

Throughout the day, the depth of water \(D\) in meters at the end of a dock varies with the tides. The depth for one particular day can be modeled by

\[
D = 3.5 + 1.5 \cos \left( \frac{\pi t}{6} \right), \quad 0 \leq t \leq 24
\]

where \(t = 0\) represents midnight.
