Homework groups: You will complete each of seven homework assignments as part of a three- or four-person group. Group members are assigned randomly and will remain the same for the duration of the quarter. Each group turns in one homework, and each participating group member receives the same grade on the assignment. One member of the group is responsible for writing the homework (the writer), and this writer rotates for every assignment.

Homework groups work best if: Each member of the homework group finishes (or honestly attempts) the homework independently. At some appointed time, well before the due date, the group meets and everyone compares answers. Any discrepancies are discussed until a consensus is achieved. The writer notes the group consensus and makes sure she or he understands how to do the problem. After the meeting, but before class, the writer neatly and clearly writes the homework according to the Homework guidelines (described below).

Homework groups don’t work if: One or more of the members skips meetings; each group member does not honestly attempt the homework prior to the meeting; a consensus in not reached for each assigned problem. If a group member does not adequately participate in the homework, write a note on the homework and alert the TA. That person will not receive credit.

Homework guidelines for writers: (Adapted from the website of Professor Andy Ruina). To get full credit, please do these things on each homework.

1. As a group writer, you must hand homework in by the end of class Wednesday, the day it is due. Homework is available via my website on Wednesday evenings, and is due the following week in class (unless stated otherwise). Late homework may or may not be accepted for reduced credit.

2. On the first page of your homework, please do the following to facilitate sorting:
   On the top left corner, please put the course information, homework number and date, e.g.:
   MAT207C
   HW 7
   Due June 5, 2019.

   On the top right corner, please put the names of your group members, with the writer at the top and clearly indicated. Non-participating group members should also be indicated, e.g.:
   Jaromir Jagr (writer)
   Sarah Jessica Parker
   Michelle Wie
   James Van der Beek (did not participate)

3. Please put a staple at the top left corner. Folded interlocked corners fall apart. Paperclips fall off.

4. CITE YOUR HELP. At the top of each problem, clearly acknowledge all help you got from TAs, faculty, students or any other source (with exceptions for lecture and the text, which need not be cited). You could write, for example: “Mary Jones pointed out to me that I had forgotten to divide by three in problem 2,” or “Nadia Chow showed me how to do problem 3 from start to finish,” or “I copied this solution word for word from Jane Lewenstein” or “I found a problem just like this one, number 9, at cheatonyourhomework.com, and copied it,” etc. You will not lose credit for getting and citing such help. Don’t violate academic integrity rules: be clear about which parts of your presentation you did not do on your own. Violations of this policy are violations of the UC Davis Code of Academic Conduct.

5. Your work should be laid out neatly enough to be read by someone who does not know how to do the problem. For most jobs, it is not sufficient to know how to do a problem, you must convince others that you know how to do it. Your job on the homework is to practice this. Box your answers.

6. Grading and regrading. We have a reasonable grading and regrading policy (see syllabus).
DUE: Wednesday, June 5, 2019. To be handed to me by the end of class.
This homework covers 1) WKB, 2) Homogenization and 3) Integral approximations.

These topics are covered in §4.1–4.3 (WKB), §5.1–5.2 (Homogenization) and §Appendix A2 in Holmes.

1. (A modified version of part of problem 3 on page 168 from Holmes, 1995) Consider the equation
   \[ \varepsilon^2 y'' + p(x)y' + q(x)y = 0 \]
a) Assuming \( p(x) \neq 0 \), find the WKB approximation of the general solution.
b) Compare your solution to the solutions you found on Homework 5, problem 4 (note that the equations, though not identical, can be made identical).

2. (Part of problem 7 on page 170 from Holmes, 1995) Consider the following equation:
   \[ p(x)y'' + (\lambda^2 q(x) - f(x)) y = 0 \]
   for \( 0 < x < 1 \) and \( y(0) = 0, y(1) = 0 \). Where \( p(x), q(x) \) and \( f(x) \) are smooth, and \( p(x) \) and \( q(x) \) are positive.
   a) Use a first-term WKB approximation to find the large eigenvalues \( \lambda \) of the equation (\( \lambda \geq 0 \)).
b) Find the corresponding first-term WKB approximation of the associated eigenfunctions.

3. (Problem 2 on page 232 from Holmes, 1995)
   Consider the problem
   \[ \frac{\partial}{\partial x} \left( D(x, \frac{x}{\varepsilon}) \frac{\partial u}{\partial x} \right) + g(u) = \frac{\partial u}{\partial t} + f(x, \frac{x}{\varepsilon}) \]
   for \( 0 < x < 1 \), where \( u = 0 \) when \( x = 0, 1 \) or \( t = 0 \). Assume \( D = D(x, \frac{x}{\varepsilon}) \).
   a) Find the homogenized problem for steady-state. Make sure to point out what assumptions you need to impose on \( f \) so the procedure can be used.
b) Find the homogenized problem for the time-dependent problem.

4. (From the 2017 Fall prelim)
   Assuming \( \lambda \gg 1 \), derive an approximation to the integral
   \[ I(\lambda) = \int_{-1}^{2} (1 + x^2)e^{-\lambda x^6} \, dx \]
   Hint: you may write your approximation in terms of the Gamma function
   \[ \Gamma(z) = \int_{0}^{\infty} x^{z-1}e^{-x} \, dx \]
