'Big Wave' Theory Challenges 'Dark Energy' - Science & Health News Briefs | Newser

WELCOME TO NEWSER!

Like the news but can't stay on top of it all? Newser's grid to the rescue!

- Blake Temple of the University of California, Davis

NEWSER Summary)
– The 'Big Wave,' a new explanation for the universe's mysterious accelerating expansion, is sending ripples through the world of astronomy. According to the theory, the Big Bang set off a wave, or waves, that rippled outward through space-time, making distant galaxies appear to expand away from us. Mathematicians came up with the Big Wave as an alternative to the Dark Energy theory, Space.com reports.

Dark Energy, which uses a hypothetical form of energy...
to explain the baffling late-'90s discovery of the universe's accelerating expansion, has never sat well with many scientists, who see it as a "fudge factor." One possible snag to the Big Wave alternative: it may require that our own Milky Way be located near the center of the universe.

IN RESPONSE:

I'm going with "The Big Spill" theory. God trips and spills his Kahlua & Coffee all over creation (His kitchen floor) and its still expanding as He's looking for the paper towels to clean it up.  

+4

IN RESPONSE:

Makes as much sense as all the new "theories" that scientists come up with every couple of years.

-1

IN RESPONSE:

How does that make as much sense? One is complex scientific theory and the other is made up on the spot. Unlike you guys, they didn't just pull that out of their ass. I'm sorry but I fail to see any similarities.

+1

IN RESPONSE:

Except Tim's 'theory' it has an imaginary friend in it.

0

Well, there goes the plans for a "warp" drive.

(Newser Summary) - The strongest-ever gamma ray blast—a burst more powerful than 9,000 exploding stars—has been detected 12.2 billion light years away in deep space, reports the Telegraph. The blast took place in September in the constellation Carina, and produced energy up to 5 billion times that of...

(Newser Summary) - Two physicists believe the fictional "warp drive" of Star Trek fame could someday become a reality, the Daily Telegraph reports. The scientists theorize that a mysterious cosmic force called dark energy could be harnessed to warp space around a vessel, allowing a spacecraft to travel faster than light—"... More »

Newser Summary - Scientists have discovered the remains of the youngest exploding star, or supernova, ever seen in the Milky Way, shedding new light on the life cycles of stars. The baby supernova G1.9+0.3 is a mere 140 years old, reports National Geographic. Supernovas are a vital component of galaxy development... More »

Newser Summary - Astronomers have been scratching their heads for years trying to figure out why exploding stars at the very edge of the universe seem to be moving faster than ones in the middle. Some theories say the acceleration is due to mysterious "dark energy," but a new one posits... More »

WHAT IS NEWSER?

Face it: there's too much news. At Newser, we choose the most important stories from hundreds of US and international sources and reduce them to a headline, picture, and two paragraphs. And we do it 24/7—you can come back morning, noon, night (and in between) for something new that matters. Read less, know more.
